1 INTRODUCTION

1.1 Purpose

Identify the purpose of this SDD and its intended audience. (e.g. "This software design document describes the architecture and system design of XX.").

1.2 Scope

Provide a description and scope of the software and explain the goals, objectives and benefits of your project. This will provide the basis for the brief description of your product.

1.3 Overview

Provide an overview of this document and its organization.
For example

The SDD is divided into 7 chapters. The chapters are:

- Chapter 1 is the Introduction: It highlights what the document is about.
- Chapter 2 provides a system overview, which gives a general description of the functionality, context and design of **PROJECT NAME**.
- Chapter 3 is the system architecture. This is the heart of the document. It is a high level overview of how responsibilities of the system were partitioned and assigned to subsystems. It identifies each high level subsystem and the responsibilities assigned to it and describes how these subsystems collaborate with each other in order to achieve the desired functionality.
- Chapter 4 explains data design, which details how the information domain of **PROJECT NAME** is transformed into data structures and describes how the major data or system entities are stored, processed and organized.
- Chapter 5 explains component design. Here we take a closer look at what each component does in a more systematic way.
- Chapter 6 gives the user interface designs of the system
- Chapter 7 gives a cross-reference that traces components and data structures to the requirements in **PROJECT NAME** SRS document.

1.4 Significance

1.5 References

This section is optional.

List any documents, if any, which were used as sources of information for the test plan.

1.6 Definitions and Acronyms

This section is optional.

Provide definitions of all terms, acronyms, and abbreviations that might exist to properly interpret the SDD. These definitions should be items used in the SDD that are most likely not known to the audience.

Table 1.1: Acronyms, abbreviations and their meanings

Acronyms and Abbreviations	Meanings
OS	Operating System
WSN	Wireless Sensor Network
SDD	Software Design Document

Definitions

Table 1.2: Important definitions

Cell	A single element of the schedule characterized by a slotOffset and channelOffset, and reserved for mote A to transmit to mote B (or for mote B to receive from mote A) within a given slot frame.
cellID	It is a number that uniquely identifies a cell.
Wireless Sensor Network	A WSN is a network formed by a large number of sensor nodes where each node is equipped with sensors to detect physical phenomena such as light, heat temperature and pressure.

2 SYSTEM OVERVIEW

Give a general description of the functionality, context and design of your project. Provide any background information if necessary.

3 SYSTEM ARCHITECTURE

3.1 Architectural Design

Develop a modular program structure and explain the relationships between the modules to achieve the complete functionality of the system. This is a high level overview of how responsibilities of the system were partitioned and then assigned to subsystems. Identify each high level subsystem and the roles or responsibilities assigned to it. Describe how these subsystems collaborate with each other in order to achieve the desired functionality. Don't go into too much detail about the individual subsystems. The main purpose is to gain a general understanding of how and why the system was decomposed, and how the individual parts work together. Provide a diagram showing the major subsystems and data repositories and their interconnections. Describe the diagram if required.

3.2 Decomposition Description

Provide a decomposition of the subsystems in the architectural design. Supplement with text as needed. You may choose to give a functional description or an object-oriented description. For a functional description, put top-level data flow diagram (DFD) and structural decomposition diagrams. For an OO description, put subsystem model, object diagrams, generalization hierarchy diagram(s) (if any), aggregation hierarchy diagram(s) (if any), interface specifications, and sequence diagrams here.

3.3 Design Rationale

Discuss the rationale for selecting the architecture described in 3.1 including critical issues and trade/offs that were considered. You may discuss other architectures that were considered, provided that you explain why you didn't choose them.

4 DATA DESIGN

4.1 Data Description

Explain how the information domain of your system is transformed into data structures. Describe how the major data or system entities are stored, processed and organized. List any databases or data storage items.

4.2 Data Dictionary

Alphabetically list the system entities or major data along with their types and descriptions. If you provided a functional description in Section 3.2, list all the functions and function parameters. If you provided an OO description, list the objects and its attributes, methods and method parameters.

5 COMPONENT DESIGN

In this section, we take a closer look at what each component does in a more systematic way. If you gave a functional description in section 3.2, provide a summary of your algorithm for each function listed in 3.2 in procedural description language (PDL) or pseudocode. If you gave an OO description, summarize each object member function for all the objects listed in 3.2 in PDL or pseudocode. Describe any local data when necessary.

$$Q(s_t, a_t) + = \alpha[r_t + \Upsilon \cdot \max_a Q(s_{t+1}, a_{t+1}) - Q(s_t, a_t)],$$

6 HUMAN INTERFACE DESIGN

6.1 Overview of the User Interface

Describe the functionality of the system from the user's perspective. Explain how the user will be able to use your system to complete all the expected features and the feedback information that will be displayed for the user.

6.2 Screen Images

Display screenshots showing the interface from the user's perspective. These can be hand drawn or you can use an automated drawing tool. Just make them as accurate as possible. (Graph paper works well.)

6.3 Screen Objects and Actions

A discussion of screen objects and actions associated with those objects.

7 REQUIREMENTS MATRIX

Provide a crossreference that traces components and data structures to the requirements in your SRS document.

Use a tabular format to show which system components satisfy each of the functional requirements from the SRS. Refer to the functional requirements by the numbers/codes that you gave them in the SRS.

Table 7.1: System components and data structures that satisfy the functional requirements from the SRS

SRS section	Requirement	Component and Data structures

8 APPENDICES

This section is optional.

Appendices may be included, either directly or by reference, to provide supporting details that could aid in the understanding of the Software Design Document.
